

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1.-29. (Canceled).

30. (Currently Amended) A handheld terminal that parses a web-document based on elements, when the handheld terminal calls the web-document from a server to the handheld terminal, the web-document being composed of a predetermined markup language and the handheld terminal being capable of supporting only one markup language, the handheld terminal comprising:

an integral parser that outputs information required for an application program of the handheld terminal from data stored in a memory or hard disc of the handheld terminal, the integral parser comprising:

a word parser that separates a token on the basis of markup and non-markup by referring to a token table for all markup data necessary for a kind of document to be supported, wherein each different token is generated by a corresponding parser, and wherein a same string of the web-document provided to the handheld terminal has a different token according to whether it is a markup or a non-markup in contrast to a general programming language; and

a syntax parser that parses a contents model on the basis of a document type definition (DTD) of each document, parses each syntax on the basis of the result of parsing the contents model, and generates a tree-based object on the basis of a graphic user interface (GUI) of the handheld terminal, and performs a mapping operation so as to represent a GUI model of a specific markup language by the GUI supported by of the handheld terminal regardless of the specific markup language, and thereby matches the parsed markup web-document to the GUI of the handheld terminal.

31. (Previously Presented) The handheld terminal of claim 30, wherein the word parser comprises:

a comment parser that processes a comment and a space;

a markup start parser that recognizes a markup start tag and generates a token;

an attribute parser that parses an attribute and generates a token; and

a parsed character data analyzer that analyzes parsed character data and generates a token, wherein the attribute parser is configured to recognize a name of an attribute or to recognize a value of the attribute.

32. (Currently Amended) The handheld terminal of claim 30, wherein the syntax parser comprises:

an XML verifier that verifies whether a corresponding web-document is composed suitable for each D'TD on the basis of the token generated by the word parser; and  
a terminal GUI-based object generator that matches the analyzed markup web-document and a- the GUI of the handheld terminal.

33. (Previously Presented) The handheld terminal of claim 30, wherein the parsing system integrally parses a web-document composed on the basis of any one of SGML and XML related to HTML, XHTML, mHTML, cHTML, WML and HDML.

34. (Canceled).

35. (Currently Amended) A method for parsing a called-web-document of called by a handheld terminal from a web-server to the handheld terminal, the web-document being composed of a predetermined markup language and the handheld terminal being capable of supporting only one markup language, the method comprising:

\* outputting information required for an application program of the handheld terminal from data stored in a memory or hard disc of the handheld terminal;

reading a token from the web-document and parsing the token using the output information;

if the token is not a defined start tag or if the token is a comment or a space as a result of the reading, ignoring the token, and when the defined start tag is read, parsing an attribute of an element from the token;

parsing the attribute of the element from the token, storing GUI-related information of the element, and parsing contents of the element;

as the result of the parsing, if the contents of the element are parsed character data, storing GUI-related information of the contents, and if the contents of the element are not the parsed character data, reading data until an end tag appears; and

in the case that the contents of the element are the parsed character data, performing a mapping operation so as to represent a GUI model of a specific markup language by a GUI (Graphic User Interface) of the handheld terminal regardless of the specific markup language, and thereby matching the parsed character data to the GUI of the handheld terminal; and

in the case that the contents of the element are not the parsed character data, if the end tag corresponding to the defined start tag appears, terminating, and if the end tag corresponding to the defined start tag does not appear, ignoring and returning, wherein the element supported by the handheld terminal for the called-web-document is separated from the web-document by at least one of defining a token table on the basis of an element supported by the handheld terminal and making the undefined token an UNKNOWN token, or ignoring the undefined token.

36. (Previously Presented) The method of claim 35, wherein the parsing comprises:  
if the read token does not include the defined start tag, reading the data continuously  
until the end tag appears, and if the end tag corresponding to the defined start tag does not  
appear, ignoring the token; and  
reading a new token.

37. (Currently Amended) A recording medium in a handheld terminal that stores a  
program for parsing a called-web-document-of called by the handheld terminal from a web-  
server to the handheld terminal, the web-document being composed of a predetermined markup  
language and the handheld terminal being capable of supporting only one markup language, the  
recording medium being read by a computer, the program comprising the functions of:

outputting information required for an application program of the handheld terminal  
from data stored in a memory or hard disc of the handheld terminal;

reading a token from the web-document and parsing the token using the output  
information;

if the token is not a defined start tag or if the token is a comment or a space as a result of  
the reading, ignoring the token, and when the defined start tag is read, parsing an attribute of an  
element from the token;

parsing the attribute of the element from the token, storing GUI-related information of  
the element, and parsing contents of the element;

if the contents of the element are parsed character data as a result of the parsing, storing GUI-related information of the contents, and if the contents of the element are not the parsed character data, reading data until an end tag appears; and

in the case that the contents of the element are the parsed character data, performing a mapping operation so as to represent a GUI model of a specific markup language by a GUI (Graphic User Interface) of the handheld terminal regardless of the specific markup language, and thereby matching the parsed character data to the GUI of the handheld terminal; and

in the case that the contents of the element are not the parsed character data, if the end tag corresponding to the defined start tag appears, terminating, and if the end tag does not appear, ignoring and returning, wherein the element supported by a the handheld terminal for the called-web-document is separated from the web-document by at least one of defining a token table on the basis of an element supported by the handheld terminal and making the undefined token an UNKNOWN token, or ignoring the undefined token.

38. (Currently Amended) A handheld terminal that parses a web-document based on elements, when the handheld terminal calls the web-document from a server to the handheld terminal, the web-document being composed of a predetermined markup language and the handheld terminal being capable of supporting only one markup language, the handheld terminal comprising:

an integral parser that outputs information required for an application program of the handheld terminal from data stored in a memory or hard disc of the handheld terminal, the integral parser comprising:

a word parser that extracts and separates tokens representing the web-document supplied regardless of a kind of a markup language used to compose the web-document by referring to a token table, wherein each different token is generated by a corresponding parser, and wherein a same string of the web-document provided to the handheld terminal has a different token according to whether it is a markup or a non-markup in contrast to a general programming language; and

a syntax parser that parses syntax for the tokens extracted and separated by the word parser on the basis of contents model, and generates an object on the basis of a GUI (Graphic User Interface) of the handheld terminal and, performs a mapping operation so as to represent a GUI model of a specific markup language by the GUI supported by of the handheld terminal regardless of the specific markup language, and thereby matches the parsed markup web-document to the GUI of the handheld terminal.

39. (Currently Amended) The handheld terminal of claim 38, wherein the token table comprises:

tokens defined in an XML document;

keywords defined in DTD for all documents provided to the handheld terminal; and

a list of elements which can be supported by each the handheld terminal.

40. (Previously Presented) The handheld terminal of claim 38, wherein the word parser comprises:

a comment parser that recognizes a comment or a space and generates a token;  
a markup start parser that recognizes a markup start tag and generates a token;  
an attribute parser that parses an attribute and generates a token; and  
a parsed character data analyzer that analyzes parsed character data and generates a token.

41. (Currently Amended) The handheld terminal of claim 38, wherein the word parser comprises a token generator and an XML well-formedness verifier, receives the supplied web-document character by character, recognizes a token of the web-document on the basis of the token table, and extracts the token by using the token generator and the XML well-formedness verifier.

42. (Previously Presented) The handheld terminal of claim 38, wherein the contents model means a hierarchy of elements and an attribute list, and is defined in a DTD for all documents provided to the handheld terminal.

Amendment dated September 21, 2009

Reply to Office Action of June 19, 2009

43. (Currently Amended) The handheld terminal of claim 38, wherein the syntax parser comprises:

an XML verifier that verifies whether a web-document is composed suitable for each DTD supplied on the basis of the token extracted and separated by the word parser; and

a GUI-based object generator that matches the parsed syntax and ~~a-the~~ GUI of the handheld terminal.

44. (Currently Amended) A handheld terminal that parses a web-document based on elements, ~~when the handheld terminal calls the web-document from a server to the handheld terminal, the web-document being composed of a predetermined markup language and the handheld terminal being capable of supporting only one markup language~~, the handheld terminal comprising:

~~an integral parser that outputs information required for an application program of the handheld terminal from data stored in a memory or hard disc of the handheld terminal, the integral parser comprising:~~

a token table comprising tokens defined in an XML document, keywords defined in a document type definition (DTD) for documents provided to ~~a-the~~ handheld terminal, and a list of elements, which can be supported by ~~each-the~~ handheld terminal;

a word parser that extracts and separates tokens of the web-document supplied to the handheld terminal regardless of a kind of a markup language used to compose the web-

document by referring to the token table, wherein the word parser includes an attribute parser configured to recognize at least one of a name of an attribute or a value of the attribute;

a contents model determined by DTDs for the documents provided to the handheld terminal that includes a hierarchy of elements and an attribute list; and

a syntax parser that parses syntax for the tokens extracted and separated by the word parser on the basis of the contents model, and generates an object on the basis of a GUI (Graphic User Interface) of the handheld terminal through the parsed syntax and, performs a mapping operation so as to represent a GUI model of a specific markup language by the GUI supported by of the handheld terminal regardless of the specific markup language, and thereby matches the parsed markup web-document to the GUI of the handheld terminal.

45. (Previously Presented) The handheld terminal of claim 44, the word parser comprises:

a comment parser that recognizes a comment or a space and generates a token;

a markup start parser that recognizes a markup start tag and generates a token;

the attribute parser that parses an attribute and generates a token; and

a parsed character data analyzer that analyzes parsed character data and generates a token.

46. (Currently Amended) The handheld terminal of claim 44, wherein the word parser comprises a token generator and an XML well-formedness verifier, receives the supplied web-

document character by character, recognizes a token of the web-document on the basis of the token table, and extracts the token by using the token generator and the XML well-formedness verifier.

47. (Currently Amended) The handheld terminal of claim 44, wherein the syntax parser comprises:

an XML verifier that verifies whether a supplied web-document is composed suitable for each DTD supplied on the basis of the token extracted and separated by the word parser; and

a GUI-based object generator that matches the parsed syntax and a-the GUI of the handheld terminal.

48. (Currently Amended) A handheld terminal that parses a web-document based on elements, when the handheld terminal calls the web-document from a server to the handheld terminal, the web-document being composed of a predetermined markup language and the handheld terminal being capable of supporting only one markup language, the handheld terminal comprising:

an integral parser that outputs information required for an application program of the handheld terminal from data stored in a memory or hard disc of the handheld terminal and parses a-the web-document composed of a predetermined markup language supplied from a web server, wherein the integral parser includes a syntax parser that performs a mapping

Amendment dated September 21, 2009

Reply to Office Action of June 19, 2009

operation so as to represent a GUI model of a specific markup language by the GUI supported by of the handheld terminal regardless of the specific markup language, and thereby matches the parsed markup web-document to the GUI of the handheld terminal;

athe memory or hard disc that stores information parsed by the integral parser; and

anthe application program using which uses information extracted from the integral parser, wherein the integral parser includes a word parser that extracts and separates tokens of the web-document supplied to the handheld terminal regardless of a kind of a markup language used to compose the web-document by referring to the token table, and wherein the word parser includes an attribute parser configured to recognize at least one of a name of an attribute or a value of the attribute.

49. (Currently Amended) A handheld terminal that parses a web-document based on elements, when the handheld terminal calls the web-document from a server to the handheld terminal, the web-document being composed of a predetermined markup language and the handheld terminal being capable of supporting only one markup language, the handheld terminal comprising an antenna, a CPU, a peripheral circuit, a vocoder, a memory, and an audio codec, wherein the memory comprises:

an integral parser that outputs information required for an application program of the handheld terminal from data stored in a memory or hard disc of the handheld terminal calls a web-document supplied from a web server regardless of a markup language used to compose

Amendment dated September 21, 2009  
Reply to Office Action of June 19, 2009

the web-document and parses the web-document on the basis of elements, wherein the integral parser includes a word parser that extracts and separates tokens of the web-document supplied to the handheld terminal regardless of a kind of a markup language used to compose the web-document by referring to the token table, and wherein the word parser includes an attribute parser configured to recognize at least one of a name of an attribute or a value of the attribute, and wherein the integral parser includes a syntax parser that performs a mapping operation so as to represent a GUI model of a specific markup language by the GUI supported by of the handheld terminal regardless of the specific markup language, and thereby matches the parsed markup web-document to the GUI of the handheld terminal; and

an-the application program-using which uses information extracted from the integral parser.

50. (Currently Amended) The handheld terminal of claim 48, wherein the integral parser comprises:

a token table comprising tokens defined in an XML document, keywords defined in a DTD for all documents provided to the handheld terminal, and a list of elements, which can be supported by each of the handheld terminals terminal;

the word parser that- which extracts and separates all tokens of the web-document supplied to the handheld terminal regardless of a kind of a markup language used to compose the web-document by referring to a-the token table;

a contents model defined in the DTD for all documents provided to the handheld terminal and meaning a hierarchy of the elements and an attribute list; and

a syntax parser that parses syntax for the tokens extracted and separated by the word parser on the basis of contents model, and generates an object on the basis of the GUI of the handheld terminal through the parsed syntax.

51. (Previously Presented) The handheld terminal of claim 50, wherein the word parser comprises:

a comment parser that recognizes a comment or a space and generates a token;  
a markup start parser that recognizes a markup start tag and generates a token;  
an attribute parser that parses an attribute and generates a token; and  
a parsed character data analyzer that analyzes parsed character data and generates a token.

52. (Currently Amended) The handheld terminal of claim 50, wherein the word parser comprises a token generator and an XML well-formedness verifier, receives the supplied web-document character by character, recognizes a token of the web-document on the basis of the token table, and extracts the token by using the token generator and the XML well-formedness verifier.

53. (Currently Amended) The handheld terminal of claim 50, wherein the syntax parser comprises:

an XML verifier that verifies whether a supplied web-document is composed suitable for each DTD supplied on the basis of the token extracted and separated by the word parser; and  
a GUI-based object generator that matches the parsed syntax and ~~a-the~~ GUI of the handheld terminal.

54. (Currently Amended) The handheld terminal of claim 48, wherein the application program comprises an object based on ~~a-the~~ GUI of the handheld terminal.

55. (Currently Amended) A method for parsing a web-document ~~supplied called by a handheld terminal from a web-server to the handheld terminal~~, the web-document being composed of a predetermined markup language ~~and the handheld terminal being capable of supporting only one markup language~~, the method comprising:

~~outputting information required for an application program of the handheld terminal from data stored in a memory or hard disc of the handheld terminal;~~

~~using the output information, reading a token from the web-document by referring to a token table, extracting and separating the token;~~

~~if the extracted and separated token is not a defined start tag or if the token is a comment or a space, ignoring the token;~~

when the extracted and separated token is recognized as the defined start tag, parsing an attribute of an element from the token and storing GUI-related information of the element;

parsing contents of the element after parsing the attribute of the element;

as the result of the contents parsing, if the contents of the element are parsed character data, storing GUI-related information of the contents, and if the contents of the element are not the parsed character data, determining whether an end tag appears;

in the case that the contents of the element are the parsed character data, performing a mapping operation so as to represent a GUI model of a specific markup language by a GUI (Graphic User Interface) of the handheld terminal regardless of the specific markup language, and thereby matches the parsed character data to the GUI of the handheld terminal;

as the result of the previous step, if the end tag does not appear, repeating the above steps, and if the end tag appears, determining whether the end tag corresponds to the defined start tag; and

as the result of the previous step, if the end tag corresponds to the defined start tag, terminating, and otherwise, ignoring and returning, wherein the element supported by ~~a~~ the handheld terminal for the called-web-document is separated from the web-document by at least one of defining a token table on the basis of an element supported by the terminal and making the undefined token an UNKNOWN, or ignoring the undefined token.

56. (Previously Presented) The method of claim 55, wherein the attribute parsing comprises:

if the extracted and separated token does not include a defined start tag, reading the data continuously until the end tag appears, thereby ignoring the token; and  
reading a new token.

57. (Currently Amended) A handheld terminal that parses a web-document based on elements, when the handheld terminal calls the web-document from a server to the handheld terminal, the web-document being composed of a predetermined markup language and the handheld terminal being capable of supporting only one markup language, the handheld terminal comprising:

an integral parser that outputs information required for an application program of the handheld terminal from data stored in a memory or hard disc of the handheld terminal and parses web-documents composed of a plurality of predetermined markup languages the web-document on the basis of elements, wherein the integral parser includes a word parser that extracts and separates tokens of the web-document supplied to the handheld terminal regardless of a kind of a markup language used to compose the web-document by referring to the token table, and wherein the word parser includes an attribute parser configured to recognize at least one of a name of an attribute or a value of the attribute, and wherein the integral parser further includes a syntax parser that performs a mapping operation so as to represent a GUI model of a

Amendment dated September 21, 2009

Reply to Office Action of June 19, 2009

specific markup language by a GUI (Graphic User Interface) of supported by the handheld terminal regardless of the specific markup language, and thereby matches the parsed markup web-document to the GUI of the handheld terminal;

a-the memory or hard disc that which stores information parsed by the integral parser; and

an-the application program-using which uses information extracted from the integral parser.

58. (Currently Amended) A system for a handheld terminal, comprising:  
a content provider configured to provide first type web-documents using a first markup language and second type web-documents using a second markup language different from the first markup language; and

a handheld terminal that receives the first and second type web-documents from the content provider, when the handheld terminal calls a web-document from the content provider to the handheld terminal, the handheld terminal being capable of supporting only one markup language, wherein the handheld terminal comprises:

an integral parser configured to output information required for an application program of the handheld terminal from data stored in a memory or hard disc of the handheld terminal and parse both a-the first type document documents and a-the second type document documents on the basis of elements to extract information thereof, wherein the integral parser

Amendment dated September 21, 2009

Reply to Office Action of June 19, 2009

includes a word parser that extracts and separates tokens of the web-document web-documents supplied to the handheld terminal regardless of a kind of a markup language used to compose the web-document web-documents by referring to the token table, and wherein the word parser includes an attribute parser configured to recognize at least one of a name of an attribute or a value of the attribute, and wherein the integral parser includes a syntax parser that performs a mapping operation so as to represent a GUI model of a specific markup language by a GUI (Graphic User Interface) of supported by the handheld terminal regardless of the specific markup language, and thereby matches the parsed markup web-documents to the GUI of the handheld terminal; and

the memory or hard disc which stores information parsed by the integral parser;

and

an application program configured to receive which receives the information extracted from the integral parser.

59. (Previously Presented) The handheld terminal of claim 51, wherein the attribute parser includes a first attribute parser configured to recognize a name of an attribute and a second attribute parser configured to recognize a value of the attribute.

60. (Previously Presented) The handheld terminal of claim 59, wherein if the value of the attribute is a keyword, the first attribute parser recognizes the name and the value of the attribute at once without distinguishing the name from the value.

61. (Previously Presented) The handheld terminal of claim 30, wherein the different tokens are as follows: <html> represents an element type, <p>html</p> represents parsed character data, <!--html--> represents a comment.
